

Net Banking System

Project Abstract

Net Banking System solution will provide a comprehensive internet based online solutions for their existing customers. This project is not only meant for banking premises but for organization who can even transfer the amount to their working employee's details just by one click. To provide a flexible working environment admin will have its panel with advanced security and facility while employees or customers will have their own account panel to carry their basic operations using their account. To make a more secure Net Banking system some encryption techniques has been implemented to secure data during online processing. It's a system to provide flexible working environment with powerful account administrative control tools.

Existing System

The traditional Net Banking System was not fast and convenient for working employees who don't get time to wait in line for carrying out their banking transactions. The cross banking solutions was not provided at their particular branch, so to make payment in other bank branches, they have to visit there. Customers were not able to check out their status by their own and dependent on working employees of bank. Sometimes you have to check the interest board and asked for service charges which may involve for your particular bank transactions. Traditional banking solutions provide no means to watch your updated account and your money on daily basis.

Proposed System

Net Banking System solutions will not only enable their customers to have their banking and balances at their fingertips but a convenient method to operate from any location. Through this system, you can pay your families and make bill payments at your own time. This system will be able to know you the extra charges which will involve in carrying out such transactions. This system will be able to make you variety of operations such as view balances, daily and monthly transactions, credit and debit history, transfer funds and even order online cheques. It will also facilitate to make transfer of fixed date and time of particular account to a valid account.

Modules

1. Login Module.
2. Admin Module.
3. Client Module.

Login Module:-

There will be single login module for admin and customers. This module will be able to check the type of users and using the concept of session it will be able to redirect to their desired panel. Even this section will be able to recover your lost password through proper validation channel.

Admin Module:-

Admin module will look after entire business transaction through a single panel. This panel will be divided into four sections for clients, account, transactions and transfers. This panel will have the facility to edit client's details and overview of particular customer. Through account module, it can add, remove, suspend and search for particular account. Transactions will have list of orders and administration over banking operations. Transfer section will add client debit and credit history along with transfer facility.

Client Module:-

Client module will be provided with following features such as getting their profile details, balance sheet, credit and debit history under account section. The transfer section will facilitate to transfer amount to inside or outside bank branches. The charges panel will be able to display the list of services and charges for it, current rate of interest for their deposited account and much more.
